

Notes Sharing Platform

Full Project Documentation

This document explains the purpose, structure, features, setup steps, and functionality of the Notes Sharing Platform project.

Project Overview

The Notes Sharing Platform is a lightweight static web application built using HTML, CSS, and JavaScript. It allows users to create, manage, search, and share notes. The app stores note data in the browser using `localStorage`, which makes it easy to use without needing a backend server or database.

Objective of the Project

The main purpose of the project is to provide a small but functional note-sharing application where users can create notes, mark them as private or public, search existing notes, and share public notes using unique access codes.

Features

Users can create notes with title, content, tags, and visibility. Public notes receive a share code. Notes can be searched by matching content, deleted, and the app supports a dark mode toggle.

Technology Stack

This project uses HTML, CSS, and JavaScript, along with browser `localStorage` for persistence. There are no external dependencies or build tools required.

Project Structure

The workspace contains `index.html`, `style.css`, `script.js`, `README.md`, and the documentation files. `index.html` defines the UI, `style.css` handles the appearance, and `script.js` contains the app logic.

Files Explanation

`index.html` contains the note form, search bar, share panel, and note card template. `style.css` includes colors, spacing, responsiveness, and dark theme styles. `script.js` handles storage, rendering, event listeners, and share code generation.

Application Flow

Users enter a title and content, then choose visibility and tags. When the form is submitted, the note is validated, saved in localStorage, and immediately displayed. For shared notes, the user provides a code and the app searches public entries for a match.

How to Run

Open the project folder and run: `python3 -m http.server 8000`. Then open `http://localhost:8000` in a browser.

Advantages

The project is easy to understand, does not require a backend, is lightweight, and is a practical example of front-end logic and UI work.

Limitations

The app stores data in the user browser only, so data is not shared across devices. It does not include user authentication, database storage, or backend security.

Conclusion

The Notes Sharing Platform is a clean beginner-friendly project that demonstrates key web development concepts and can later be expanded into a full-stack application.

Key Implementation Summary

The main logic in `script.js` defines data constants, DOM elements, default note objects, rendering methods, event listeners, and `localStorage` persistence. The page responds dynamically without reloading, making the app feel interactive and modern.

The app has a simple but effective architecture:

- Create or update note objects
- Persist data to `localStorage`
- Render changes to the DOM
- Filter notes by search input
- Display public notes and share codes
- Toggle dark mode for visual preference

This project demonstrates a practical and approachable path to learning front-end development with HTML, CSS, and JavaScript.
